All versions of Kea offer:
- DHCPv4 standards compliance
- DHCPv6 with prefix delegation
- Dynamic DNS (DDNS)
- Optional storage of leases and host reservations in a structured database (MySQL, PostgreSQL, Cassandra)
- REST management API configuration updates without restarting
- Load-balancing or active-passive pairs for high availability
- Flexible client classification with regular expression support
- Kea hooks API for easy extension and customization
- Support on most UNIX and LINUX-based operating systems

Confidential Technical Support
Support subscription customers get quick access to our experienced technical support staff and our full-time professional DHCP software development experts, with a confidential ticket queue and shared access for your DHCP technical team. Customers can ask questions and share configuration data in a private setting.

We can also provide up to four hours of basic configuration audits and advise you on deployment options, analyze log files, and troubleshoot problems. ISC can review your standard configuration, zone, and log files; draft a summary report indicating potential areas of concern; and deliver this information in a support ticket. In some cases, we may also recommend a more comprehensive configuration audit.

Available 24x7 SLA Response
We offer a range of service levels, including 24x7 on-call access for critical issues.

Priority Fixes
While we fix all serious defects no matter their source, we prioritize fixing bugs and making enhancements requested by support subscribers.

Private Repository
Subscribers get access to a private, access-controlled package repository, so you can be sure your Kea software is always up-to-date.

Online Documentation
Links to the complete Kea Administrator’s Reference Manual (ARM) and our extensive Knowledgebase are available at https://kea.isc.org.
Premium Software - Kea Hooks

Kea is both flexible and customizable, via the use of “hooks.” This feature lets Kea load one or more dynamically linked libraries (known as “hook libraries”) and call functions in them at various points in its processing. Those functions perform whatever custom processing is required.

Your enterprise support subscription at any level includes access to all of our extended Kea features, including these hook libraries that are only available to ISC’s paid support subscribers:

- The **Forensic Logging** hook library allows administrators to record a detailed log of lease assignments and renewals into a set of log files.

- Traditionally, DHCPv4 servers use the MAC address to uniquely identify clients. However, you may not always have a listing of all MAC addresses. If your users are supplying their own devices (BYOD), you might want to identify them based on circuit ID or remote ID. In the case of a cable network, you might want to use some identifier supplied by the CMTS. With the Kea **Flexible Identifier** hook library, the system administrator can specify what field to use as the unique identifier.

- The **Host Commands** extension enables you to store host reservations in a separate backend MySQL or PostgreSQL database, and add or remove host reservations on demand, without restarting Kea.

- The **Class Commands** and **Subnet Commands** libraries provide APIs allowing you to list, add and delete subnets, shared networks and client classes stored in your Kea configuration. (These libraries are not required when using the Configuration Backend.)

- The Kea **Configuration Backend** extension enables you to store most of your shared Kea configuration elements in a separate backend database, and update these without restarting Kea.

- If you are already using RADIUS for access control, you can leverage that for providing DHCP access control with our Kea **RADIUS** library. The **Host Cache** library provides a way to cache responses from other hosts, improving performance when using a database backend.

- The **Leasequery** library allows you to retrieve a single lease, identified by IP address, hardware address, or client identifier. This command retrieves leases in either the default memfile storage on the Kea server, or in a separate database backend.

- The **GSS-TSIG** library is used to authenticate DDNS updates via GSS-TSIG, using Kerberos mechanisms to retrieve dynamic keys. This capability is of particular importance to Windows networks, as this is usually the only method available in an Active Directory environment. Kea supports two Kerberos implementations: MIT and Heimdal.
Kea DHCP vs. ISC DHCP

ISC offers two DHCP servers – the older ISC DHCP software, and the newer Kea. Both are open source software, and both support both DHCPv4 and DHCPv6 to assign IP addresses and provide configuration information to network devices such as servers, desktops, or mobile devices as they communicate on an IP network. However, there are some key differences:

**ISC DHCP**
- Mature system in widespread use
- Includes client and relay agent as well as DHCP server
- DHCPv4 and DHCPv6 are a single daemon
- Requires restart after server modifications
- Offers extensive client classification logic with a scripting language
- Implements DHCPv4 failover IETF Internet draft
- In maintenance mode, with infrequent updates and releases
- Community-contributed LDAP integration
- Proprietary OMAPI remote management interface

**Kea DHCP**
- Newer, modern software
- DHCP server only; includes separate daemons for a DHCPv4 server, a DHCPv6 server, and dynamic DNS (DDNS)
- Does not require restart after subnet/pool additions or modifications
- JSON configuration file can be modified remotely
- Offers simpler High-Availability mechanism for failover for both DHCPv4 and DHCPv6
- Features Kea Hooks API for easy customization and extension; you can write your own hooks modules (in C++) or try some of the hooks we offer
- Flexible REST management API
- In active development, with monthly updates and stable releases roughly twice a year
- Optional storage of leases and host reservations in a structured MySQL, PostgreSQL, or Cassandra database backend
- Optional configuration backend, using MySQL
- Open source management application from ISC (Stork)

**Stork, a Web-based graphical dashboard for Kea**

Stork makes it easy to monitor multiple Kea servers. Agents deployed on the servers relay information to a centralized management platform, providing the administrator with an easy-to-use, quick view of system status and activity.
Advance Security Notification

From time to time, security issues arise with any software. To safeguard our customers' data, we use a managed disclosure process to alert customers to important security vulnerabilities. Support subscription customers receive advance notice up to 5 days before publication of a security vulnerability in Kea, with a patch that removes the vulnerability. This allows subscription customers to update their systems before the vulnerability is generally known and potentially exploited. In some cases, it may be impossible for us to provide advance notice; in that event, we provide patch support as soon as possible.

Open source software is a secure, flexible, commercially-viable solution for companies' and organizations' DHCP needs. A Kea support subscription from ISC offers you the benefits of reliable, stable DHCP software, but frees your IT staff from the potential hassles of IP address management so they can focus on your core business.

Pricing is based on service level and deployment size. Support subscriptions are on an annual contract basis. Premium software is for use by subscriber organizations only and may not be redistributed.

Kea premium hooks
- Flexible Identifier
- Host Commands
- Forensic Logging

Kea subscriber-only hooks
All premium hooks, plus:
- RADIUS integration
- Host Cache
- Subnet Commands
- Class Commands
- Configuration Backend
- Leasequery
- GSS-TSIG
